Abstract

Two different hand-held phones operating at 1.8 GHz are numerically analyzed, applying a field calculation program MAFLA (Maxwell's equations using the Finite Integration Algorithm). One phone contains a Back-Mounted Microstrip Double Patch Antenna (BMMDPA), the other, for comparison a conventional monopole. Realistic models of the handset, the head and the hand are used to gain a detailed understanding of the antenna properties, as well as of the antenna-tissue interaction.

Keywords:

BMMDPA, Model, Handset, Microstrip patch, Absorbed power, Antenna

1. Introduction

There is a growing public concern about possible health hazards caused by the use of handheld transceivers. Of course, this has an impact on the antenna development for such handsets. To get rid of the most often used, but unfavourable monopole antennas, various antenna configurations have been studied in the literature. Most of them are small, flat configurations which can be conveniently integrated with the handset. Among existing built-in antenna schemes much attention has been paid to planar inverted F antennas (PIFA) as described by Tokio [1], Jensen and Rahmat-Samii [2], Jensen [3], Rahmat-Samii [4], and also radiation-coupled dual-L antennas (RCDLA), investigated by Fuhl et al [5], Shtrikman and Fruechting [7]. Recently, Ruoss and Landstorfer proposed a double-T slot antenna with reduced absorbed power in the human body [8]. However, their antenna is bulky and has a small bandwidth.

The limited bandwidth is also an unpleasant feature of microstrip patch antennas. Therefore, a second radiation-coupled patch is used in our work to overcome this difficulty without enhancing the thickness of the antenna.

It is the purpose of this paper to demonstrate that a backside-mounted microstrip double patch antenna (BMMDPA) is an alternative configuration with great advantages in terms of the absorbed power in the user's head, without an unacceptable degradation of other important antenna parameters. On contrary, the antenna efficiency, for example, is greatly enhanced for the microstrip structure compared to the monopole.

2. Model and Method

The structure of the BMMDPA and the model of the handset are given in Fig. 1.

Fig. 1. Model of the handset with BMMDPA

For both antenna configurations the chassis is a conductive box with dimensions: 130 mm x 50 mm x 30 mm. The BMMDPA consists of two microstrip patches with the same width of 15 mm. The larger patch, which is connected to a coaxial line, has a length of 22 mm, the shorter with length of 18 mm. Both patches are short-circuited at one side, whereas the opposite side near the upper rim of the handset is open. The substrate with a dielectric constant of $\epsilon_r = 2.0$ has a thickness of 8 mm.

In the other example, the monopole consists of a wire of length $L = 41.6$ mm, placed in the center of one small side of the box.

In order to obtain reliable results, the model of the head is derived from high resolution CT-data by transforming the original Housfield units into values for the permittivity and conductivity at the operating frequency. As indicated in Fig. 2, the model distinguishes five different tissues, the electrical parameters of which we taken from literature. For the limitation of CPU-time, a cell-size of $5 \times 5 \times 5 \text{ mm}^3$ is chosen.

Fig. 2. Cut through the 3D-Model of the head

The whole configuration of the two handsets, together with the heads and the hands is illustrated in Fig. 3a) and 3 b).

Fig. 3a) Handset with head and hand - Monopole

Calculations are performed applying the field evaluation program MAFIA, developed by Weiland et al. [6].

Fig. 3b). Handset with head and hand - BMMDPA

3. Results

For the handsets with monopole and microstrip antenna, the SAR-distributions in the heads and hands are given in Fig. 4a) b) and 5a) b) for two different cuts. In all cases the transmitted CW power is 1W.

Fig. 4a). SAR - distribution in horizontal cut for the Monopole

Fig. 4b). SAR - distribution in horizontal cut for the BMMDPA

Fig. 5a). SAR - distribution in vertical cut for the Monopole

Fig. 5a). SAR - distribution in vertical cut for the BMMDPA

Fig. 6. Scale for the Fig.: 4a) b) and 5a) b).

As is clearly demonstrated, the peak power density absorbed in the head of the user is much smaller in the case of the BMMDPA. In the case of the monopole a relatively large amount of power is absorbed in the head, not only in the auricle, but also in the brain and along the cochlea.

The time averaged poynting vector for the monopole antenna is given in Fig 7a). The large amount of the power enters into head especially into brain and auricle. The main direction of the radiation is not full horizontally as in the case of the monopole with conductive plane. The handset radiates a little down.

Fig. 7a). Power flow for the Monopole (time averaged poynting vector)

The power flow in the case of the BMMDPA in the same cut through the head as in previous figure is given in Fig. 7b). In comparison with the monopole antenna only very small part of power enters into head. On the other hand, the power entering into hand is larger in comparison with the monopole. Also in this case the main power flow is moved down from the clear horizontally direction

The logarithmic scale is the same for both figures {Fig. 7a) b)}.

Fig. 7b). Power flow for the BMMDPA (time averaged poynting vector)

Fig. 8: Reflection coefficient of the model with BMMDPA

	Monopole	BMMDPA
absorbed power in the head	38 %	7 %
absorbed power in the hand	12 %	23 %
radiated power	50 %	68.3 %
conductor losses *	0 %	0.4 %
dielectric losses **	-	1.3 %

Table 1: Power balance for monopole and BMMDPA (* conductor: copper; ** $\tan\delta = 0.001$)

A conceal point of flat antennas for personal communication systems is bandwidth. To confirm the calculated results, both the simulated and the measured reflection coefficients are given in Fig. 8. For that purpose a model has been realized according to Fig. 1. The calculated and measured curves of Fig. 8 are obtained from realistic conditions with the handset in the hand of the ear.

Details about the radiated and absorbed power fractions are summarized in Table 1.

4. Conclusions

A backside-mounted microstrip double patch antenna (BMMDPA) offers a useful alternative to other antenna structures for portable phones. Thanks to the low permittivity, the high thickness of the substrate and the application of two radiation-coupled patches, the bandwidth of the BMMDPA is sufficiently large.

Compared to handsets with monopole antennas the following advantages can be stated:

*Reduced power in the head. The peak power densities are 10.6 mW/cm^3 and 1.5 mW/cm^3 for the monopole and the BMMDPA, respectively.

*Enhanced antenna efficiency of 70 % for the BMMDPA compared to 50 % for the monopole.

Up to now, most producers of handsets prefer monopole antennas or slight modifications.

However, as is demonstrated in this paper, this antenna type is disadvantageous from a medical point of

view. Further, it wastes valuable battery energy only to heat the head.

About author...

Richard DLOUHÝ was born in Počátky, in 1970. He received the MSc. degree at Czech Technical University of Prague, in 1994. From October 1994 he is a

postgraduate student at the Department of Electromagnetic Field of the CTU in Prague. From October 1995 he works in Laboratories for High Frequency Technology, University Erlangen-Nuernberg, Germany.

CALL FOR PAPERS

<http://www.vsb.cz/KALENDAR/KONFERENCE/ddecs.html>

Conference on
Design and Diagnostics
of Electronic
Circuits and Systems '97

DDECS '97

May 12 - 14, 1997

Short Courses of
TEMPUS Project S_JEP-09468-96
Education for Quality Control in
Electrical Industry

EQUATOR

May 15 - 17, 1997

organized back to back by the VŠB Technical University of Ostrava
in BIOCEL Soláň Mountain Hotel (830 m. above sea level)
Beskydy Mountains, Czech Republic

Auspices:

Tomáš Čermák
VŠB Technical Univ. of Ostrava
Czech Republic

Ivan Adamčík
(TEMPUS Project Contractor)
Czech Technical Univ. in Prague
Czech Republic

General Chair:

Jan Hlavička
Czech Technical Univ. in Prague
Czech Republic

Programme Co-Chairs:

Karel Vlček
VŠB Technical Univ. of Ostrava
Czech Republic

Vladimír Drábek
Technical University of Brno
Czech Republic

Organizing Chair:

Vilém Srovnal
VŠB Technical Univ. of Ostrava
Czech Republic

Technical Vice-chair:

Jan Štefan
VŠB Technical Univ. of Ostrava,
Czech Republic

AIM:

The aim of the DDECS '97 Conference is to exchange the scientific and technical informations on quality of design, diagnostics and reliability in electronic production. The DDECS '97 Conference is a logical continuation of the Seminars „Diagnostics of Microprocessors“ organized by Czech Technical University of Prague and the Seminar DDECS '95 organized by VŠB-Technical University of Ostrava. The TEMPUS Project S_JEP 09468 Meeting and Short Courses on quality control are organized back to back with DDECS '97 Conference in order to have the opportunity to invite the lectures from experts, which will participate in the Meeting. Scientific research being an indispensable part of University activities represents a very important input for the teaching activity of every educator. The organizers of the DDECS '97 Conference hope that this interaction will take place not only in national but in international scale.

MAJOR TOPICS (Include, but are not limited to):

- * Design and Diagnostics for High Quality
- * DSP Syst. and Mixed Signal Diagnostics
- * Automatic Test Generation Methods
- * Diagnostics in Telecommunication
- * Analog Circuit Models and Test Methods
- * Reliability and Quality in Electronics

CALL FOR PAPERS - INFORMATION FOR AUTHORS:

Prospective authors are invited to send the abstracts of their contributions on relevant topics. Extended abstracts (5 pages) should be sent in four copies. The abstracts should be structured as follows:

- Author's name, E-mail address, and full mailing address.
- Problem statement, methods of research.
- Clear description of key aspects of contribution.
- Achieved results and their applicability.
- References.

Abstract should be sent before 30th December, 1996 by E-mail (in WORD6 format), by mail, or by fax to the address of the Programme Co-Chair:

Assoc. Prof. Ing. Karel Vlček, CSc., FEI, VŠB-TU of Ostrava, Czech Republic
Phone: +42 69 699 1501, FAX: +42 69 691 9597, E-mail: karel.vlcek@vsb.cz

The authors of accepted papers will be informed by the letter of acceptance before 3rd February, 1997, and Camera Ready copy will be due on 17th March, 1997.

PROGRAMME COMMITTEE

Dimitar Avresky, Bulgaria
Brian R. Bannister, United Kingdom
Jaromír Brzobohatý, Czech Republic
Andrea Clematis, Italy
Bernard Courtois, France
Elena Gramatová, Slovakia
Jan Hlavička, Czech Republic
